JALA Academy
Assignment 1

Python Basics & Variables

Python solution reference • Code examples are organized by the assignment questions.

How to use this document

Save the code examples into a .py file and run with Python 3. Where a program asks for input, enter values when prompted. For file-handling exercises, create the named text file in the same folder first.

1. Print your name

```
print("Inchara Urs")
```

2. Comments in Python

```
# This is a single-line comment.
"""
This is a multi-line comment.
Comments explain code and are ignored by the Python interpreter.
"""
print("Comments make code easier to understand.")
```

3. Basic data types

```
age = 21
height = 5.4
is_student = True
initial = "I"

for value in (age, height, is_student, initial):
    print(value, type(value))
```

4. Local and global variables

```
value = "global value"

def show_scope():
    value = "local value"
    print("Local:", value)
    print("Global:", globals()["value"])

def update_global():
    global value
    value = "updated global value"

show_scope()
update_global()
print("After update:", value)
```

5. Dynamic typing

```
item = 10
print(item, type(item))
item = "Python"
print(item, type(item))
item = 3.14
print(item, type(item))
```

6. User input

```
name = input("Enter your name: ")
age = int(input("Enter your age: "))
print(f"Name: {name}; Age: {age}")
```
