JALA Academy
Assignment 2

Operators in Python

Python solution reference • Code examples are organized by the assignment questions.

How to use this document

Save the code examples into a .py file and run with Python 3. Where a program asks for input, enter values when prompted. For file-handling exercises, create the named text file in the same folder first.

1. Arithmetic operations

```
def arithmetic(a, b):
    print("Addition:", a + b)
    print("Subtraction:", a - b)
    print("Multiplication:", a * b)
    if b != 0:
        print("Division:", a / b)
    else:
        print("Division is undefined when the second number is zero.")

arithmetic(12, 4)
```

2. Increment and decrement

```
def increment_decrement(number):
    print("Original:", number)
    number += 1
    print("After increment:", number)
    number -= 1
    print("After decrement:", number)

increment_decrement(10)
```

3. Equality check

```
a, b = 5, 5
if a == b:
    print("Numbers are equal")
else:
    print("Numbers are not equal")
```

4. Relational operators

```
a, b = 7, 10
print("a < b:", a < b)
print("a <= b:", a <= b)
print("a > b:", a > b)
print("a >= b:", a >= b)
```
