JALA Academy
Assignment 6

Strings in Python

Python solution reference • Code examples are organized by the assignment questions.

How to use this document

Save the code examples into a .py file and run with Python 3. Where a program asks for input, enter values when prompted. For file-handling exercises, create the named text file in the same folder first.

1–13. String operations

```
single = 'Hello'
double = "Python"
triple = """Strings can span multiple lines."""
print(single, double, triple)

first, second = "Bright", " IT Career"
print("Concatenation:", first + second)
text = "Python programming"
print("Length:", len(text))
print("Substring:", text[0:6])

needle = "gram"
print("find:", text.find(needle))
try:
    print("index:", text.index(needle))
except ValueError:
    print("Substring not found")

print("Equal:", "python" == "Python")
print("Not equal:", "python" != "Python")
print("Starts with Py:", text.startswith("Py"))
print("Ends with ing:", text.endswith("ing"))

a, b = "apple", "banana"
if a < b:
    print(a, "comes before", b)
elif a > b:
    print(a, "comes after", b)
else:
    print("Strings are equal")

print("Stripped:", "  hello  ".strip())
print("Replaced:", text.replace("Python", "Java"))
print("Split:", text.split())
number = 42
number_text = str(number)
print(number_text, type(number_text))
print(text.upper())
print(text.lower())
```
