JALA Academy
Assignment 10

Packages & Modules in Python

Python solution reference • Code examples are organized by the assignment questions.

How to use this document

Save the code examples into a .py file and run with Python 3. Where a program asks for input, enter values when prompted. For file-handling exercises, create the named text file in the same folder first.

File: mypackage/class_one.py

```
class ClassOne:
    def __init__(self, name):
        self.name = name

    def display(self):
        return f"ClassOne name: {self.name}"
```

File: mypackage/class_two.py

```
class ClassTwo:
    def __init__(self, value):
        self.value = value

    def display(self):
        return f"ClassTwo value: {self.value}"
```

File: mypackage/__init__.py

```
from .class_one import ClassOne
from .class_two import ClassTwo

__all__ = ["ClassOne", "ClassTwo"]
```

File: main.py — imports and usage

```
import mypackage.class_one
from mypackage.class_two import ClassTwo as SecondClass
from mypackage import ClassOne

one = mypackage.class_one.ClassOne("Inchara")
two = SecondClass(100)
three = ClassOne("JALA")

print(one.display())
print(two.display())
print(three.display())
```

Project structure

```
JALA-Python-Assignments/
■■■ main.py
■■■ mypackage/
    ■■■ __init__.py
    ■■■ class_one.py
    ■■■ class_two.py

Run from the project root using:
    python main.py
```
