Assignment 11

File Handling in Python

Python solution reference • Code examples are organized by the assignment questions.

How to use this document

Save the code examples into a .py file and run with Python 3. Where a program asks for input, enter values when prompted. For file-handling exercises, create the named text file in the same folder first.

1. Read a text file

```
# Create sample.txt in the same folder before running this example.
with open("sample.txt", "r", encoding="utf-8") as file:
    print(file.read())
```

2. Write and append

```
message = input("Enter text to save: ")
with open("sample.txt", "w", encoding="utf-8") as file:
    file.write(message + "\n")

extra = input("Enter more text to append: ")
with open("sample.txt", "a", encoding="utf-8") as file:
    file.write(extra + "\n")
```

3. read(), readline(), readlines()

```
with open("sample.txt", "r", encoding="utf-8") as file:
    print("read():")
    print(file.read())

with open("sample.txt", "r", encoding="utf-8") as file:
    print("readline():")
    print(file.readline())

with open("sample.txt", "r", encoding="utf-8") as file:
    print("readlines():")
    print(file.readlines())
```

4. Random access with seek()

```
with open("sample.txt", "r", encoding="utf-8") as file:
    file.seek(5)
    print("Text from character position 5:")
    print(file.read())
```
